

5                   "Reciprocating               electromagnetic               micro-pump,  
particularly for small electrical appliances"

Abstract of the description

10           Reciprocating electromagnetic micro-pump, particularly  
for small electrical appliances, whose pumping chamber  
is defined by a tubular element, movable axially,  
against the action of a contrasting spring, between an  
advanced position of normal operation of the pump and a  
15           retracted position in which the outlet fitting of the  
pump is placed in communication with the cavity of the  
hollow body within which is movable in reciprocating  
fashion the core bearing the piston and which in turn  
communicates with the inlet fitting of the pump, in such  
20           a way as to absorb and anomalous overpressures  
generated, in operation, downstream of the pump.
